

Differences versus claim 1

An installation of electronically controlled fittings, in particular of both an electronic controller unit for preparing mixed water and a setting element, for preparing mixed water in one single compact device unit of the fitting seems not to be obvious from this published document because the expert is not provided with any indications or suggestions to that extent. Furthermore, DE 34 14 510 C2 involves a simple magnetic switching valve for opening or closing the one water pipeline 11.

As distinguished from the above, claim 1 requires, in addition to other features, that the setting element is acting on a rotatably supported setting body, so that a mixture of the hot and cold water corresponding with the rotational position assumed by that adjusting body can be produced within a mixing body and supplied by way of a hot water feed and a cold water feed.

Indications or suggestions pointing in the direction of a combination of the features of claim 1 are not contained anywhere in DE 34 14 510 C2.
